CurvaFix

A privately held medical device company founded in 2017 to develop implantable products to improve bone repair following serious fracture and injury.

Products and Intended Use

The CurvaFix® Intramedullary Rodscrew is a novel implantable device for the fixation of pelvic fractures. CurvaFix has developed the only device capable of following the natural bone shape and filling the space within curved bones such as the pelvis. CurvaFix's patented solution has the potential to improve patient outcomes and enable a less invasive approach in pelvic trauma surgery. The device received 510(k) clearance from the U.S. Food and Drug Administration (FDA) in 2019. It is not currently available for sale.

Funding & Investors

CurvaFix raised \$2.6 million dollars in Series A. Delta Dental of Washington Seed Fund led the financing.
