CurvaFix

A privately held medical device company founded in 2017 to develop implantable products to improve fracture repair in curved bones. The company is focusing on Fragility Fractures of the Pelvis (FFP) and high-impact pelvic fractures.

Products and Intended Use

The CurvaFix® IM Implant is a novel solution designed to improve outcomes and decrease costs for pelvic fracture patients. The CurvaFix Implant is offered in two diameters—9.5mm and 7.5mm—and is available in lengths ranging from 90mm to 180mm. Both CurvaFix Implants have received 510(k) clearance from the U.S. Food and Drug Administration (FDA).

The only curved intramedullary fixation devices capable of following each patient's individual bone shape, the CurvaFix Implants are designed to offer strong, curved fracture fixation with a simple, minimally invasive procedure for pelvic fracture patients, leading to a quicker recovery.

As multiple case studies have demonstrated, the CurvaFix procedure has the potential to overcome the limitations of existing implants used for pelvic fracture fixation in both high-impact trauma and FFPs while improving patient recovery, immediately reducing pain, and enabling earlier mobility compared to traditional techniques.
